## Amendments to the Claims

Claims 1-53 (Cancelled)

Claim 54 (Currently Amended): A type I polyketide synthase which produces a polyketide and which comprises a loading module and a plurality of extension modules, wherein:

- a) said loading module loads an optionally substituted malonyl and then effects decarboxylation of the loaded moiety to provide a corresponding optionally substituted acetyl moiety for transfer to the first of said extension modules; and
  - b) said loading module is of the form:
    (engineered-KSq)-(AT)-(ACP), wherein:
    - i) ACP is an acyl carrier protein domain;
- ii) AT is an acyltransferase domain which loads an optionally substituted malonyl; and
- iii) engineered-KSq is a <u>ketosynthase (KS)</u> domain which has been genetically engineered to effects decarboxylation of a loaded optionally substituted malonyl by mutating the active site cysteine residue to a glutamine residue, wherein said engineered-KSq domain is obtained by replacing the active site cysteine of a KS domain of an extension module with a glutamine; and

c) at least the first of said extension modules is not naturally associated with said loading module;

wherein the polyketide produced by the polyketide synthase is other than a 14-membered macrolide having a 13-methyl group due to incorporation of an unsubstituted acetate starter.

Claim 55 (Previously Presented): A type I polyketide synthase according to claim 54, wherein said acyltransferase domain has an arginine residue in the active site.
